Frame It as Cases — Work That Speaks for Itself

FlyRank General AI Fluency
Week 2 – Foundations

Student Name: Kanak Chaudhary

Program: BCA

Date: July 31, 2026

Table of Contents

1. Voice Card	
2. Case Study 1 – FlyRank AI Engineering Portfolio	
3. Case Study 2 – AI Internship Landing Page.....	
4. Portfolio Bio	
5. Contact / CTA	
6. Before vs After	
7. Learning Outcomes.....	

1. Voice Card

My portfolio voice is built to hold up under a recruiter's first 10-second scan and a technical reviewer's 10-minute deep dive alike. It leads with decisions, not just deliverables.

Tone: Confident, precise, outcome-driven — no filler adjectives.

Style: Plain language over jargon; concrete numbers and artifacts over vague claims.

Point of View: I explain the reasoning behind a build, not just the finished output.

Signature Line: *“I design data models that anticipate future features, not just current requirements.”*

2. Case Study 1 – FlyRank AI Engineering Portfolio

■ The Problem

My internship footprint was spread across FlyRank, VaultofCodes, BeeSkilled, CodSoft, and Labmentix, each living as a separate certificate or repo.

Recruiters had no single place to see frontend and AI/data skills together, so strong individual work was easy to overlook.

■ What I Did and Decided

Consolidated every internship and project into one portfolio site instead of a scattered list of links.

Chose a project-first structure over a chronological timeline, so capability is visible before dates are.

Committed to a navy-gold-cream visual system to keep the brand recognizable across every page and post.

■ What Came of It

One cohesive, shareable portfolio link that replaces five separate credential mentions.

Faster recruiter evaluation — skills and outcomes are visible without digging through certificates.

A consistent visual identity now reused across resume, LinkedIn, and this document.

■ What I'd Do Differently

Add live demo links and quantified impact metrics from the very first draft, not as a later pass.

Get outside feedback on the case-study framing earlier, before the layout was finalized.

3. Case Study 2 – AI Internship Landing Page

■ The Problem

The Frontend AI Engineering track needed a landing page that proved both frontend execution and AI-product thinking — not just a static resume.

Most student landing pages default to a generic template that doesn't demonstrate real component or accessibility decisions.

■ What I Did and Decided

Built a responsive, component-based landing page rather than a single monolithic HTML file.

Carried forward accessibility patterns (`aria-invalid`, `aria-describedby`, `role="alert"`) from earlier form work into this page's inputs and messaging.

Prioritized a clear content hierarchy — problem, capability, proof, contact — over decorative visuals.

■ What Came of It

A working landing page that reads as both a frontend sample and an AI-fluency proof point.

Reusable component patterns now available for future project pages.

A concrete artifact to link directly in outreach messages and applications.

■ What I'd Do Differently

Run a short round of user testing before locking the layout, instead of after.

Spend more time up front on message clarity and copy, since the code was solid before the words were.

4. Portfolio Bio

Kanak Chaudhary is a BCA student and AI Engineering intern building at the intersection of frontend development and applied AI. Currently in the Frontend AI Engineering track at FlyRank, her work spans accessible React interfaces, full-stack project architecture, and applied machine learning case work.

Her approach favors decisions that anticipate what a system will need next — not just what a task requires today — a principle reflected across her project documentation, from database schema design to component structure.

She is currently seeking internship and entry-level opportunities in frontend development and AI/data, bringing a portfolio that includes ML analysis projects, quantitative research simulations, and shipped frontend components.

5. Contact / CTA

Let's talk. If you're reviewing candidates for a frontend or AI/data role, I'd welcome the conversation.

Name: Kanak Chaudhary

Email: [your email address]

LinkedIn: [your LinkedIn URL]

Portfolio: [your portfolio site URL]

Call to action: View the full case studies and project repos on my portfolio, or reach out directly to schedule a conversation.

6. Before vs After

BEFORE	AFTER
Long list of internship names and certificates	One narrative portfolio organized by case study
Skills described as bullet points on a resume	Skills shown through documented problem → decision → outcome
Projects presented as finished outputs only	Projects presented with the reasoning behind key decisions
Generic "worked on X" statements	Specific proof statements, e.g. designing for future features
Inconsistent visuals across platforms	One consistent navy-gold-cream visual identity

7. Learning Outcomes

- ✓ Learned to frame technical work as a problem → decision → outcome narrative rather than a feature list.
- ✓ Practiced writing proof statements that make a design decision defensible, not just describable.
- ✓ Built a repeatable structure for turning any project into a recruiter-ready case study.
- ✓ Recognized the value of a consistent voice and visual identity across every platform.
- ✓ Identified gaps in earlier work — missing metrics, late user feedback — to fix in future case studies.
